ASSIGNMENT 6B : Ring Algorithm

```
import java.util.Scanner;

public class Ringg {

    public static void main(String[] args) {

        Scanner sc = new Scanner(System.in);

        int p[] = new int[10];

        System.out.println("Enter number of processes:");
        int n = sc.nextInt();

        for (int i = 0; i < n; i++) {
            System.out.println("Enter process id:");
            p[i] = sc.nextInt();
        }

        int max = p[0];

        for (int i = 1; i < n; i++) {
            if (p[i] > max)
                max = p[i];
        }

        System.out.println("\nProcess " + max + " selected as coordinator");

        while (true) {

            System.out.println("\n1.Election  2.Quit");
            int ch = sc.nextInt();
```

```
            if (ch == 1) {

                System.out.println("Enter initiator process index:");
                int start = sc.nextInt();

                int i = start;

                do {
                    int next = (i + 1) % n;

                    System.out.println(
                        "Process " + p[i] +
                        " sends message to " + p[next]);

                    i = next;

                } while (i != start);

                System.out.println(
                    "\nProcess " + max +
                    " selected as coordinator");
            }

            else {
                System.out.println("Program terminated...");
                break;
            }
        }
    }
}
```
